JARVIS

Jarvis
Capabilities Report

Your own team of AI experts on your desktop. What Jarvis is, what it can do for you, and how to use every feature.

- **Maya** — Personal assistant
- **Ryan** — Project manager & tech lead
- **Sara** — Health & nutrition
- **Victor** — Money & business

Version 0.9.1 · Windows · November 2026

github.com/msja1729/Jarvis

Contents

1. Jarvis in one page
2. Getting started
3. Talking to Jarvis
4. Meet the team
5. Maya: personal assistant
6. Ryan: project manager & tech lead
7. Sara: health & nutrition
8. Victor: money & business
9. What makes the team experts
10. Lessons and visual explanations
11. Documents and code
12. Looking at your screen
13. Meetings and recordings
14. Email, calendar and your other apps
15. Reminders, morning plan and project board
16. Coding supervisor
17. Web search
18. Music, apps and the Tool Hub
19. Conversations and history
20. Activity
21. Safety, permissions and privacy
22. Settings reference
23. Installing, updating and uninstalling
24. Current limits and what's next
25. Quick reference

> **How to read this report.** Sections 1–3 explain what Jarvis is and how you use it day to day. Sections 4–9 introduce the four team members and what makes them experts. Sections 10–20 cover each capability in detail. Sections 21–25 cover safety, settings, installing and the current limits. Phrases in *italics* are things you can type or say.

1 Jarvis in one page

Jarvis is a desktop app that gives you a small team of AI specialists who know your life in their field. You talk to them by typing or by voice, from any app, and they work in the apps you connect, but only in the ways you allow.

Who's on the team

- **Maya**: your schedule, email, deadlines, daily plan, reminders, music, and every personal task.
- **Ryan**: projects and coding (he runs Claude Code on Opus 5.5), meeting minutes, plans and deadlines.
- **Sara**: health, food, sleep, exercise, symptoms and medical reports.
- **Victor**: budgets, debt, investing basics, purchases, tax and business numbers.
- **Jarvis**: the front desk; welcomes you, introduces the team and passes everything to the right person.

What you can do with them

- Ask questions and get answers based on **your** numbers and history, not generic advice.
- Turn emails into deadlines, tasks and reminders; plan your day around your energy.
- Record a meeting and get minutes plus your action items on a board.
- Have code written, tested and reviewed on your projects while you do something else.
- Learn anything with narrated, animated lessons, diagrams and interactive maths.

What makes Jarvis different from a normal AI chat

Jarvis	What it means for you
Specialists, not one generalist	Each member follows an expert's method and step-by-step playbooks for their field, asks the questions that matter, and pushes back when facts are missing.
They remember you	Each member keeps structured files about you (Sara: health profile and lab history; Victor: balance sheet, cash flow, investment rules; Ryan: roadmap; Maya: your schedule and writing style) and uses them every time.
They act, not just talk	Read and draft email, add calendar events, set reminders, manage a project board, record meetings, play music, run coding work, read your documents.
Always within reach	Push-to-talk from any app, a small voice card above the taskbar, a floating chat box, natural human-sounding voices, and the music pauses while you talk.
You stay in control	Every action goes through your permission settings (Off / Ask me first / Allowed); anything that sends, deletes or spends always asks; everything is logged.
Private by design	Your chats, memory, files, voice and sign-ins stay on your computer. It runs on your own Claude Pro or Max plan; no extra AI subscription.

2 Getting started

What you need

Computer	Windows 10 or 11 (64-bit). A Mac version is planned.
Claude plan	A Claude **Pro** or **Max** plan. Jarvis uses Claude Code with your own sign-in; it helps you install and sign in during setup.
Graphics card (recommended)	An NVIDIA graphics card makes speech recognition nearly instant (about 0.2 seconds per sentence). Without one, voice still works but is slower.
Disk space	About 500 MB for the app, plus the voice and speech models you choose to download (natural voices about 326 MB; speech recognition about 1.3 GB on NVIDIA computers), plus Claude Code if you don't have it.
Microphone	Optional; needed to talk to the team and to record meetings.

Installing

1. Download **Jarvis-Setup-0.9.1.exe** from the GitHub releases page and run it.
2. Windows may show "Windows protected your PC" because the installer isn't code-signed yet: click **More info** → **Run anyway**.
3. Choose where to install (or keep the default) and click Install. Jarvis opens when it finishes.

The welcome

The first time Jarvis opens, it walks you through setup with a short animated welcome. A drifting world map stays behind every page.

Step	What happens
The opening	Stars rush in and settle into a turning globe of dots; your team lights up around it as glowing nodes with their names; they flow into the middle where the Jarvis logo forms (an outer ring, an open ring, a dotted ring and two short arcs turning around a glowing core); **J A R V I S** arrives with a sweep of light, and the globe slowly unrolls into the world map. Click anywhere to skip it. Then click **Let's set you up**.
1. Your name	What the team should call you ("Nice to meet you, …" appears as you type). Every member learns it.
2. Connect your Claude	Two live checks: **Claude Code installed** and **Signed in**. Buttons open a window that installs Claude Code or signs you in through your browser. The page ticks each one by itself. Jarvis never sees or stores your Claude login.
3. Your team's tools	Switches for web search, lessons, documents, meeting recorder, screen look, reminders, project board and the coding supervisor (all on to begin with). Email, calendar and other apps come from your Claude account (section 14).
4. Voices	Downloads the natural voices and speech recognition with progress bars (you can skip and do it later), and asks **how to say your name**: type it the way it sounds, syllable by syllable, and press **Hear it**.
Meet your team	Jarvis says hello, then each member introduces themselves in their own voice while their glowing orb follows their speech, their skills appear and each word appears exactly as it is said (following the voice itself). The introductions are written fresh by Claude for you, warm and a little playful. Mute and Skip are always available.

You can replay the introductions (Settings → Meet the team again) or run the whole setup again at any time.

3 Talking to Jarvis

Four ways to talk

Where	How	Good for
Main window	Open Jarvis → Chat	Longer conversations, history, lessons, everything at once.
Push-to-talk	`Ctrl+Alt+Space` from any app	Talk without switching windows: press, speak, and it stops listening when you pause (or press again). Speak as long as you need: a long explanation, like a project's specification, is never cut, and you can pause to think.
Voice card	Appears above the taskbar; `Ctrl+Alt+J` shows or hides it	Hands-free answers: the reply is spoken; the card stays hidden unless you want to read it (hiding it doesn't stop the speech). It comes up by itself when a member needs something from you (a drop box) or when answers are not spoken. Drag its top row to move it, drag an edge to resize it, – minimises it to the taskbar, × closes it; it stays where you put it.
Floating box	`Ctrl+Shift+Space`	A small chat window that floats over your work, with the world map behind it. Drag its title bar to move it, drag an edge to resize it; its buttons minimise it, open the main window or close it.

Whatever you ask on the voice card or in the floating box also shows in the main chat right away, with the member's first words, and stays in the same conversation.

Choosing who you talk to

Start your message with a member's name and you stay with them until you name someone else:

- *Sara, I've had a headache since yesterday.* → Sara answers, and your next messages (*it gets worse in the evening*) stay with her.
- *Victor, can I afford a new laptop?* → now you're with Victor.
- Job titles work too: *doctor, …*, *PA, …*, *project manager, …*, *accountant, …*.
- Names misheard by speech recognition still work (*Sarah* → Sara, *Viktor* → Victor), and names you change on the Team page work the same way.
- You can also click a member's chip above the chat box. Your very first message, before you've named anyone, goes to Maya.

Natural voices

- 21 natural, human-sounding voices (American and British, male and female) that run on your computer.
- Each member has their own voice, which you can change on the Team page (with a Play sample button).
- Replies start speaking while they are still being written, so you hear the first sentence in a few seconds.
- Spoken questions get short, spoken-style answers; ask for detail and you get more.
- You can adjust the speaking speed, or switch speech off (Settings, or say *mute* / *unmute*).

Speech recognition that understands everyone

- Uses Whisper large-v3-turbo, a strong model that copes with fast, casual speech and many accents (Indian, British, American, European, East Asian and more).
- On computers with an NVIDIA graphics card, a sentence turns into text in about **0.2 seconds**. In tests with fast, rough speech in ten accents, it made about 40% fewer mistakes than the previous model.
- The silence around your words is trimmed and soft or rushed speech is evened out before recognition.
- The team's names and yours are given as hints, so they're spelled correctly.
- Everything happens on your computer: your voice is never uploaded.

Your name, said right

Voices read names by English spelling rules, so many names (Indian names especially) come out wrong. Jarvis keeps a "say it like" spelling for your name, for example *Priyanka* → *Pree-yaan-kaa*. Claude suggests one, you press **Hear it** and adjust it until it sounds right (during setup, or in Settings → You). Only the sound changes; your name is still written correctly.

Music pauses while you talk

When you start talking, anything playing (Spotify, YouTube in your browser, VLC and most media apps) pauses. It stays paused while the team answers, then resumes on its own. It also pauses when the team speaks on their own (reminders, the morning plan, lessons, coding updates). Only what Jarvis paused is resumed. You can switch this off in Settings.

Instant commands (no AI needed)

Say or type	What happens
record this meeting (or lecture, call, appointment, interview), … *and take notes*	Starts recording; the named member (or Ryan) takes notes when it ends.
stop recording, *the meeting is over*	Stops, transcribes and hands the notes job to the right member.
new conversation, *new chat*	Starts a fresh conversation.
open Tool Hub	Opens your apps and permissions.
mute, *unmute*	Turns spoken replies off or on.

4 Meet the team

Jarvis is the front desk. Behind it are four specialists. Each one is a complete expert setup: a role, step-by-step skills, their own apps, a memory of you, a folder on your computer, a natural voice and a name you can change.

Member	Field	Typical requests
Maya PA	Schedule, email, deadlines, reminders, daily and weekly planning, errands, travel, bills, music, anything personal	*Plan my day. Check my email for deadlines. Remind me to call Mom at 9. Play some lo-fi.*
Ryan Project Manager	Projects, coding with Claude Code, specs, plans, estimates, meeting minutes, code review, status reports	*Add a login page to my app. Record this meeting and note down my tasks. How's the project going?*
Sara Doctor	Symptoms, lab reports, nutrition, exercise, sleep and stress, medicines, preventive screening	*Explain my blood test. What should I eat to lower my HbA1c? I keep waking up at 3 am.*
Victor Finance	Budgets, debt and EMIs, investing basics, purchase decisions, tax basics, business analysis	*Make me a monthly budget. Should I buy this phone? Is my startup idea profitable?*

Working as a team

- **They consult each other.** A member can ask a teammate for facts. Maya asks Ryan about project deadlines before planning your day, or asks Victor about a bill before drafting a reply. When the questions don't depend on each other, a member asks two or three teammates **at the same time** and gets all the answers together (Ryan asks Victor about the cost and Sara about the health side at once). A teammate who is asked only reads and answers; they never change files while doing so.
- **They work at the same time.** Ask Maya something, then Victor straight away: both work at once, and you can keep typing while they do. Each member answers their own requests in order.
- **Helpers for big jobs.** A member can split a job into parts that run side by side, for example three countries' interest rates or five lab reports at once. Helpers only read and search; the member writes the result after they report back, so they never get in each other's way.
- **One voice at a time.** When several members have something to say (a reply, a coding update, a lesson), they speak in turn, never over each other.
- **They read each other's folders** (but only write in their own): Maya can see Ryan's roadmap and Sara's health notes when planning.
- **Each keeps their own conversation**, so a chat with Sara never gets mixed up with your coding work with Ryan.
- **You can rename them** and choose each one's voice on the Team page.

5 Maya: personal assistant

Maya Personal assistant and chief of staff · protects your time and energy

Maya looks after your day and everything personal no other member covers: errands, bills, travel, bookings, important dates and forms. She plans around **your energy**, turns email into action, and makes sure nothing sneaks up on you.

Her skills

Inbox triage	Sorts email into four tiers: **Act now** (she drafts the reply right away), **Needs a teammate** (she asks Ryan, Victor or Sara for the facts, then drafts), **Read later** (a short daily digest) and **Noise** (just counted). Every deadline becomes a board task with reminders; likely phishing is flagged; nothing is sent without your OK.
Daily plan	Builds your day around your energy: the hardest task in your deep-work window, admin in your low-energy slot, buffers between meetings, meals and breaks, your top 3 priorities. She pushes back when low-value tasks land in your best hours, and adds reminders 10 minutes before meetings.
Weekly review	What got done, what slipped, the next two weeks (meetings, exams, deadlines, birthdays, bills, travel) and next week's priorities.
Email writing	Drafts that sound like you, matching your greeting, sign-off, tone and sentence length from your own example emails, and never using AI-sounding phrases ("I hope this email finds you well").
Personal admin	Running lists (to-do, shopping, renewals, important dates), reminders well ahead of bills and renewals, travel research and packing lists, and the documents you need for forms. She never books, pays or enters passwords for you.
Meeting prep	A short brief before meetings, calls and interviews: purpose, people, recent emails, questions to raise, what to bring.

What she keeps about you

About me (working hours, deep-work window, best time for meetings, protected time, recurring commitments, important people, preferences) and **Writing style** (your example emails, greeting and sign-off, phrases to avoid). Plus her folders: Plans, Inbox notes, Personal lists.

Her apps

Gmail & Microsoft 365 · Google Calendar · Your other apps · Reminders · Project board · Meeting recorder · Documents · Web search · Team folders

Proactive

Turn on her **morning plan** (Team page → set a time) and every day she goes through your new email, puts deadlines on the board, plans the day, saves it, and tells you the shape of your day out loud. She also says your **reminders** out loud at the right time, even if the main window is closed.

6 Ryan: project manager & tech lead

Ryan Project manager and tech lead · ruthless about scope, quality and finishing · thinks with Opus 5.5

Ryan runs your projects. He turns ideas into specs and plans, runs the coding with Claude Code in the background, reviews the result, takes meeting minutes, and keeps the roadmap and board current. He uses **Opus 5.5**, the strongest model for building software.

His skills

Spec gate (coding brief)	Before **any** coding, Ryan writes a SPEC.md for the change (goal, scope, context, design, edge cases, breaking changes and risks, test plan, definition of done, open questions), shows you a summary and waits for your OK. Only then does he start Claude Code, with a brief that includes your coding standards and the tests that must pass.
Scope guard	When a new idea or change of plans arrives, he scores it (RICE or MoSCoW), checks it against your roadmap and the board's workload, shows what it would push back and by how long, and recommends: do now, schedule next, or park it. He's allowed to say "not now".
Project brief	A one-page brief for a new project or feature: problem and users, goals and non-goals, must/should/could, user stories with acceptance criteria, approach, milestones, risks.
Plan breakdown	Splits work into tasks of half a day to two days, orders them by dependencies and risk, estimates with three-point estimates plus a buffer, and puts milestones and tasks on the board.
Meeting minutes	From a recorded meeting: summary, key points, decisions, an action-item table with owners and dates (your own tasks marked), open questions. Your tasks go on the board with reminders, and the project status and roadmap are updated.
Status report	Red, amber or green with the reason, then done, in progress, next, blocked, risks and the decisions he needs from you.
Code review	Correctness, security, tests, design, performance and readability, with findings ranked by severity, each with file and line and a concrete fix.

What he keeps

Roadmap (now / next / later, decisions made), plus reference files: **Coding standards** (your preferred stack and rules), **Spec template** and **Definition of done**. Folders: Projects (one folder per project, with Brief, Plan, SPEC, Status, Risks) and Meetings.

His apps

Coding supervisor (Claude Code) · Documents & code · Project board · Reminders · Calendars · Meeting recorder · Screen look · Web search (official docs) · Team folders · Apps you add (e.g. GitHub)

7 Sara: health & nutrition

Sara Health coach with a careful clinician's method · not a replacement for an in-person doctor

Sara gives practical, evidence-based help with food, sleep, exercise, stress, everyday symptoms and medical reports, and she reads every result against **your own history**, not just population ranges.

Her skills

Symptom check	Red flags first (if one fits, she tells you to get emergency help now, before anything else). Then **OPQRST** questions one or two at a time (onset, what makes it better or worse, what it feels like, where, how bad, how it changes), then 2–4 likely explanations, a clear triage level (emergency / today / within days / self-care), safe self-care, and "get help sooner if…".
Lab reports	Reads the whole report, records every value in your **biomarker table** (including values you just tell her), compares with your previous results to spot trends, and reads patterns, not single numbers. She points out urgent values and gives you questions for your doctor. In testing, given HbA1c values of 5.6 → 5.9 → 6.1 she said "the steady upward trend matters more than any single number" and linked it to the family history and habits in the health profile.
Nutrition plan	Calorie needs from your body and activity, protein targets, the plate method, meals from your own cuisine in household measures, a shopping list, and swaps instead of bans; adapted for diabetes, blood pressure, pregnancy or allergies.
Exercise plan	A safety screen first, then a realistic weekly plan (frequency, intensity, time, type) that builds up gradually, including strength work.
Sleep and stress	The proven methods behind CBT for insomnia, sleep habits, a 2-week sleep diary, and short stress techniques; plus when to see a professional.
Medicine information	What a medicine does, how to take it, common versus serious side effects and interactions, from trusted sources. She never changes a prescribed dose.

What she keeps about you

Health profile (age, conditions, medicines, allergies, baseline blood pressure and weight, lifestyle, goals, what your doctor said) and the **Biomarker table** (every lab value with date, unit and the lab's range). Reference files: **Red flags**, **Lab ranges** (your report's own range always wins) and a **Preventive screening schedule**; she tells you which screenings apply to you now.

Her apps

Web search (medical authorities only: WHO, NIH, NHS, Mayo Clinic…) · Documents (reports, PDFs) · Lessons · Screen look · Team folders

> **Safety lines Sara never crosses:** she doesn't diagnose with certainty, never changes prescribed medication, and always sends you to emergency services or a doctor for warning signs (chest pain, trouble breathing, stroke signs, fainting, heavy bleeding, thoughts of self-harm).

8 Victor: money & business

Victor Money and business analyst who works from your real numbers · information, not regulated advice

Victor turns money questions into clear numbers: what you can afford, what a decision really costs, and whether it fits your goals. He shows the maths and the assumptions, and holds you to the investment rules you set while you were calm.

His skills

Purchase evaluator	"Should I buy this?": the price as a share of your take-home pay, months of savings it uses, the effect on your emergency fund, **opportunity cost** (what the money would grow to if invested), the interest if on EMI, cost per use, cheaper alternatives, and whether it delays a goal. Then a clear verdict (buy now / wait / skip) with the deciding numbers.
Investment policy	Writes your own rulebook: goals, horizon, risk you can live with, target allocation, rebalancing rule, and **rules for bad days** (what you promise not to do in a market fall or a hype rally). Later, when you want to act on fear or hype, he holds you to it.
Budget	Picks a method that fits you (50/30/20, zero-based, pay-yourself-first), checks your emergency fund, builds a planned-vs-actual table, finds the 2–3 biggest savings with amounts, and can categorise a bank statement you give him.
Debt payoff	EMI and total interest, avalanche vs snowball compared with your numbers, prepaying vs investing, refinancing or consolidating, and warning signs.
Investing basics	The right order (emergency fund, high-interest debt, insurance, then goals), allocation by goal and horizon, low-cost diversified funds, compounding shown at realistic returns after inflation, and the usual traps.
Tax basics	Your country's current rules looked up on official sources, saved with the date and link, a worked estimate with your numbers, and deadlines as reminders through Maya.
Business analysis	Unit economics (margin, break-even, customer acquisition cost vs lifetime value), market size from the bottom up, pricing, a 12-month projection with worst/base/best cases, and the 3 assumptions to test first.

What he keeps about you

Balance sheet (assets, liabilities with rates and EMIs, net worth), **Monthly cash flow** (income, fixed and variable costs, savings rate) and **Investment policy**. Reference files: **Formulas** (EMI, compounding, monthly investing, real returns, opportunity cost, emergency-fund cover, debt-to-income, break-even) and **Rates and rules**, which only ever holds figures he has verified on official sources, with the date.

His apps

Web search (official sources for rates and tax) · Documents (statements, spreadsheets, PDFs) · Lessons and charts · Screen look · Team folders

> **Safety lines:** general information, not regulated financial advice (for big decisions he suggests a licensed, fee-only adviser). He never asks for passwords, card numbers, one-time codes or bank logins.

9 What makes the team experts

Each member is built on Claude: the same knowledge and reasoning. What turns them into specialists is everything around the model:

Ingredient	What it gives you
An expert method	Every member works the same way: start from your files → if a fact that changes the answer is missing, ask 1–3 specific questions first (never generic advice) → follow the right skill → update your profile → end with one concrete next step. No filler.
Skills (playbooks)	27 step-by-step procedures across the team (listed in sections 5–8), so the expert process is followed every time without you writing a careful prompt.
Profile files	Structured facts about you in each field, loaded automatically at the start of every conversation and kept up to date as you talk.

Ingredient	What it gives you
Reference files	Checked material they must use instead of guessing: red flags, lab ranges, screening schedules, finance formulas, verified tax rates, spec templates, definition of done.
Memory	Notes about you, summarised as you talk. You can read, edit, summarise or erase them on the Team page.
Their own folder	A real folder on your computer (Team → PA, Project Manager, Doctor, Finance) where they keep plans, minutes, notes, budgets and research, organised by date. Open it from the Team page.
Trusted sources	Web search steered to the right sites for each field (medical authorities, official regulators, official software docs).
The right tools and model	Only the apps their job needs, and a stronger model where it pays off (Ryan on Opus 5.5).

Make your team better: what you can do

Out of the box they are good generalists in their field. Everything below turns them into *your* assistant, *your* doctor, *your* advisor and *your* project manager. Open any member's folder from the **Team** page (**Open folder**); the files are ordinary documents you can open in Notepad or any editor, and your edits are never overwritten.

1. **Fill in their Profile files** (the **Profile** folder). The facts in them are read at the start of every conversation, so you never repeat yourself. Lines still saying *(not filled in yet)* are skipped.

Member	Profile files	What to put in
Sara	Health profile.md, Biomarkers.csv	Age, height and weight, conditions, medicines with doses, allergies, your usual blood pressure, sleep and activity, goals, what your own doctor told you. One row per lab value in Biomarkers.csv (date, marker, value, unit, the lab's range).
Victor	Balance sheet.md, Cash flow.md, Investment policy.md	What you own and owe, monthly income after tax and your regular costs, your emergency fund, your goals and how much risk you accept.
Ryan	Roadmap.md	Your projects, what each one is for, deadlines and what matters most right now.
Maya	About me.md, Writing style.md	Your routine, work hours, people who matter to you, preferences; how you write emails (formal or casual, how you sign off) so her drafts sound like you.

2. **Or just tell them, once.** *Victor, I earn 60,000 a month after tax and pay 15,000 rent*, *Sara, I'm allergic to penicillin*, *Maya, I never take meetings before 10*. They write it into their profile themselves and use it in every future answer.

3. **Give them your own reference material** (the **Reference** folder). They use it instead of guessing:
   - Ryan: *Coding standards* (your languages, style, testing rules), *Spec template*, *Definition of done*. Every coding brief includes them.
   - Sara: *Lab ranges* (put in the ranges printed on your own lab's report), *Screening schedule*, *Red flags*.
   - Victor: *Rates and rules* (your country's tax slabs, interest rates, limits, each with the date and source you checked), *Formulas*.

4. **Teach them your own skills** (the **Skills** folder). A skill is a Markdown (.md) file: the first line is its title (they see it in their skills list and pick it when a task matches), then the steps or rules you want followed. The file name becomes its name. They follow it within their usual safety rules (a skill can't switch those off). Up to about 12,000 characters each. For example, *Project Manager/Skills/Weekly status report.md*:

   ```
   # Weekly status report for my team (use every Friday or when I ask for a status report)
   1. Read Roadmap.md and the board; list what was finished this week.
   2. List what is late, with the reason and a new date.
   3. Name the top 3 risks, each with one action.
   4. Keep it under 200 words, in bullet points, and save it in Projects/<project>/Status/ with today's date.
   ```

   More ideas: Sara: "*My diabetes check-in*" (which numbers to ask for and how to compare them with last month); Victor: "*Monthly budget review*" (your categories and limits); Maya: "*How I want my inbox sorted*" (who is always important, what to ignore).

5. **Show them your documents.** Say *Sara, I want to show you something* or use the paperclip: lab reports, prescriptions, bank statements, bills, project briefs, a code folder. The file is kept in that member's folder, so they can come back to it later.

6. **Check what they remember.** Team page → **What Sara remembers**: read it, correct a wrong fact and save, or **Forget everything** to start over.
7. **Correct them when they're wrong.** *No, I stopped that medicine in June*: they update their notes and profile, so the mistake doesn't come back.
8. **Give them the right apps.** In the Tool Hub, connect your email, calendar or other apps and choose **who can use** each one (Maya for email and calendar, Ryan for GitHub or Notion, and so on).
9. **Set how they explain things.** Settings → "How Jarvis explains things": Automatic, Like I'm five, Student or Professional.

10 Lessons and visual explanations

When something is clearer when seen, a member explains it with a **lesson**: a narrated, step-by-step presentation that opens in its own window on the empty side of your screen (or full screen), with each picture appearing exactly as the voice explains it.

What a lesson can show

Diagrams and charts

- Flowcharts, process and relationship diagrams
- Bar, line and pie charts
- Tables, notes and highlighted key points
- Moving scenes that animate a process

Visual maths

- Curves that draw themselves; a tangent that slides as a value changes
- Shaded areas and rectangles that fill the area under a curve
- Vectors and a whole grid that bends under a matrix
- Equations that transform step by step, each quantity in its own colour

- **Interactive:** drag points, move sliders, scroll to zoom, drag to pan, and replay any step.
- **References:** quotes from a document, pieces of code, or a cut-out of your screen, numbered with a reference list at the end.
- **Adapts to the question:** a simple question gets a plain answer; an idea gets a short lesson; a problem or a deep topic gets four parts: **Problem** → **Intuition** → **Solution** → **Recap**.
- **At your level:** Settings → "How Jarvis explains things": Automatic, Like I'm five, Student, or Professional (precise terms, trade-offs, real code). You can also just say *explain like I'm five*.
- **Controls:** `Space` pause, arrow keys step, `F` side or full screen, `Esc` close; push-to-talk pauses the lesson so you can ask a follow-up.
- The lesson is narrated in the voice of the member who made it. Sara uses lessons to show how the body works, Victor to chart budgets and compounding.

11 Documents and code

- **Open a file or folder you pick** (a window asks you which; a member never browses your computer on their own): PDFs, text, spreadsheets as text, and whole code projects.
- **Read only what's needed:** pages of a PDF or ranges of lines, with answers that cite where they came from (page numbers, file and line).
- **Search an opened folder** for words or code.
- **Secret files are never opened** (keys, passwords, `.env` files).
- Typical uses: *Sara, explain this blood report* · *Victor, categorise this bank statement* · *Ryan, how does login work in this project?*

12 Looking at your screen

- Ask *what's this error on my screen?* or *explain this chart* and a member takes **one** screenshot for that request.

- You choose what to share (a window, a whole screen, or an area you draw), and a small indicator shows when your screen is being looked at.
- The member only ever looks when you ask; never in the background.

13 Meetings and recordings

- *Ryan, record this meeting and note down the tasks given to me*: records your microphone and your computer's sound (the other people on the call, a video you play), and transcribes it on your computer as the meeting goes on.
- **The screen too** (on by default, Settings → Meeting recorder): a full-HD video of the screen with all the sound, plus a sharp picture each time the screen changes and then holds still: a new slide, a shared document, writing on a whiteboard. A playing video is not photographed frame by frame. The transcript marks when each picture was shown.
- When writing the notes, the member **looks at those pictures** (slide titles, figures, diagrams, what was written on the board) and puts what was shown into the minutes.
- When you say *stop recording*, the member you asked writes it up in their own style:
  - **Ryan** (also the default): minutes, decisions, an action-item table, your tasks on the board with due dates and reminders, project status and roadmap updated.
  - **Sara** (*Sara, record this appointment*): what the doctor found, tests, medicines with doses, instructions, warning signs and the follow-up date; reminders through Maya.
  - **Maya** or **Victor**: notes with every task, deadline, figure and decision that involves you.
- The notes are saved in that member's folder and the text transcript stays on your computer. The video and pictures are only used to write the notes: **once the notes are written they are deleted**, so they don't pile up (about 14 MB a minute). If the notes can't be written, they are kept. To keep them, turn on **Settings → Meeting recorder → Keep the video and pictures**; they then stay in **Videos → Jarvis Meetings**, even if you uninstall Jarvis. Sound is never kept separately: the short audio pieces used for transcription are deleted as they are transcribed.
- Always tell people when you record them; the rules differ between countries.

Help during a live meeting

- While a meeting is being recorded you can still press the push-to-talk key: *Ryan, what did they just ask?*, *what should I answer?*, *what did we decide about this last time?*
- The member reads the last minutes of the meeting (and your meeting notes and board for past decisions) and gives a 1–3 sentence answer you can use right away.
- During a recording the answer appears **quietly** on the voice card for 45 seconds and is not spoken, so nothing is played into the meeting. (Mute yourself in the meeting app while you ask.)

Show your team anything

- Say *Sara, I want to show you something* (or *Victor, look at this bill*): that member gives you a **drop box** in the chat, in their colour (on the voice card if you were talking by voice). Drop a file, or click **Choose files**.
- It is saved in **their own folder → Shared with me**, dated, so you can find it later from the Team page; your original stays where it was.
- They take it in straight away: **photos** are looked at, **PDFs** are read, **videos** become a picture of each scene (like the meeting slides) plus a timed transcript of what is said, and **recordings** become a timed transcript. All of this happens on your computer; for long videos, the first 40 minutes.
- You can also drop files on the chat or use the **paperclip**: they go, with your message, to the member who answers it.

They show you what they made

- When a member wants you to see a document, picture or report (*Maya, show me my trip plan*), a **large preview opens next to the chat**, like Claude's side panel. The window grows if it needs room.
- It shows **Markdown documents** fully drawn (headings, tables, task lists, code, and flowcharts), **pictures**, **PDFs** (with pages, zoom and search), **web pages** (with their scripts switched off), **spreadsheets (CSV)**, code and text, **video** and **sound**.
- Several files appear as a strip at the top: click one to preview it, use ← / →, or **double-click (or the corner button) to open it big**, filling the window (F or Esc to go back). Buttons open it in its own app or show it in its folder; you can drag the edge to make the preview wider.

- A card in the chat lists what was shown, so you can open it again later, also from an earlier conversation.
- Only files in the team folders are ever shown, never secret files.

"On it, about 2 minutes"

- When a request needs work (searching email, writing a draft, opening files), the member first says **right away** what they will do and roughly how long it takes, then works. Their progress shows quietly under the typing dots, and the answer follows.

"What did they just say?" (listen-along)

- *listen along* (or *listen to this lecture*): Jarvis listens to your **computer's sound** (a lecture, a video, a call), not your microphone. A small "Listening along" badge shows at the top of the screen with a Stop button.
- Ask any time: *what did he just say?*, *explain that*, *what was the formula?*, *summarise the last 10 minutes*. The words said a moment ago are included.
- Private by design: speech is turned into text on your computer; only the text of the **last 15 minutes** is kept, in memory only, and it is forgotten when you say *stop listening*. Jarvis's own voice is never included.

14 Email, calendar and your other apps

Outside apps come from **your Claude account**: the connectors you add on claude.ai (Gmail, Google Calendar, Google Drive, Microsoft 365, Notion, Slack, Spotify, Asana, Canva, Figma and many more). Connect an app once on claude.ai and sign in; your team can use it in Jarvis straight away. There is nothing to register or set up.

What the app is asked to do	Examples	Default permission
Read and search	Read and search email, list calendar events, find a file, look up a page	Allowed
Make changes and send	Draft or send an email, add an event, post a message, play a song	Ask me first (a popup shows exactly what will happen)
Delete or spend money	Delete an email or event, cancel, pay	Always asks; can never be set to Allowed

Typical uses: *Maya, what's on my calendar tomorrow? · reply to the professor and ask for an extension to Friday · find all deadlines in my email this week*. Email and app content is treated as information only: instructions hidden inside an email are never followed.

- **Jarvis is the gatekeeper.** Claude talks to the app directly, but every single action first goes to Jarvis: is this member allowed this app, and is this kind of action Off, Ask me first or Allowed? Everything is logged on the Activity page.
- **Each member sees only their apps.** An app goes to the members whose field it fits (email and calendar to Maya, GitHub-style coding apps to Ryan, PubMed and Clinical Trials to Sara); the others don't even see its tools. You can change who uses each app.
- **Personal Outlook.com** addresses are not supported by Claude's Microsoft 365 connector (work and school accounts are). claude.ai's **GitHub Integration** works only inside claude.ai, so it does not appear in Jarvis.

15 Reminders, plans, medicines, bills and the project board

- **Reminders:** *Maya, remind me to submit the form at 5 pm*. At the time, Maya says it out loud on the voice card, in her voice. Reminders missed while Jarvis was closed are said when it opens.
- **Morning plan:** set a time on the Team page and Maya plans your day every morning (email triage, calendar, board, your energy), saves it and tells you.
- **Evening review:** set a time on the Team page (or press **Wrap up my day now**) and Maya tells you, out loud, what got done today, what is still open, what is due tomorrow with times, and anything you missed in email; new deadlines go on the board with reminders.
- **Medicines and follow-ups:** *Sara, the doctor prescribed amoxicillin 500 mg twice a day for 5 days*. Sara sets a reminder for every dose at times that fit your day, for exactly 5 days, adds it to your profile, and reminds you of the follow-up visit the day before and two hours before; she says them in her own voice. After a recorded appointment she does this by herself, and asks rather than guessing a dose.
- **Bills and receipts:** drop a bill on the chat (or use the paperclip) and say *Victor, file this*: he records payee, amount and due date in your budget (Bills.csv), points out anything unusual (a higher bill, a new subscription, a late fee), and has Maya remind you 3 days before and on the day. He never pays or logs in anywhere.

- **Forms:** drop a form and say *Maya, help me fill this*: she fills what the team already knows (from everyone's profiles), marks guesses and unknowns, never fills passwords, card or ID numbers, and lists what only you can answer, the documents to attach and the deadline.
- **Project board:** a simple To do / Doing / Done board on the Team page, shared by Maya and Ryan, with projects and due dates. You can add tasks yourself; the team adds tasks from emails, meetings and coding work automatically.

16 Coding supervisor

Ryan runs real coding work on your projects with Claude Code, in the background, and acts like a good team lead between you and it. (It's on by default; turn it off in the Tool Hub.)

1. *Ryan, build me a study planner app*: a popup asks you to name the new project (Ryan suggests a name). It gets its own folder in Ryan's **Projects** folder (Team page → Ryan → Open folder), and its spec and every code file go there. When you continue a project, he uses its folder without asking. Only for a project you already have somewhere else (*add a login page to my project in D:\Code\shop*) do you pick its folder.
2. Ryan writes the **spec** and waits for your OK (section 6).
3. Claude Code works in the background while you do something else. Safe steps (reading, editing project files, running tests and builds) are approved for you according to your setting.
4. When Claude has a question or wants to do something risky, a small card appears (and is spoken) with **Ryan's recommendation and reason**, in plain words ("*Let Ryan install the add-on axios from the internet?*", with the exact command in small print). Answer by clicking or by voice: *go with yours*, *the second one*, *no, keep it*.
5. **Or let the team decide.** Say so in your own words (*I'm in a meeting, sort it out with the team*, *don't ask me, you decide*) or turn on **Team decides** on the card. Ryan then answers Claude's questions himself, asking Victor, Sara or Maya when it touches their field, and approves ordinary steps. No popups and no spoken updates. Three things are never done without you: publishing online, anything outside the project folder (including your computer's settings) and files that may hold passwords or keys. These are skipped, and the summary at the end lists what the team decided and what it left for you.
6. You get progress updates while it works, and a summary at the end with the **test results** and the **list of changed files**; Ryan checks it against the spec and updates the board.
7. He can start your website or app and leave it running for you to try; his reply comes right away, while it keeps running.

Setting	Options
How much Ryan may approve	**Careful** (asks for any change), **Balanced** (approves low-risk steps), **Hands-off** (approves low and medium risk). High-risk actions (deleting, pushing to git, installing packages, network access, anything outside the project, key or password files) **always** ask you.
Updates	Every few minutes or only at milestones; spoken or silent.
Your own sessions	Optionally, Jarvis tells you when Claude Code sessions you started yourself (VS Code, terminal) finish or need you.

You can also give more instructions while it runs (*also add a "remember me" box*), ask for progress, stop it, or open the project in VS Code.

17 Web search

- Built in for every member; no account needed. Search the web and read pages for current facts, prices, news and documentation.
- **Steered to trusted sources by field:** Sara uses medical authorities (WHO, NIH, MedlinePlus, NHS, Mayo Clinic, CDC); Victor uses official government and regulator sites; Ryan uses official documentation; others use reliable general sources.
- Members name their sources and only give links that actually came back from the search, never made-up links.
- Web pages are treated as information only; instructions on a page are never followed.

18 Apps and the Tool Hub

The **Tool Hub** is where you choose which apps your team can use, and exactly what they may do in each.

For every app

- **On / off** switch.
- **For every ability: Off / Ask me first / Allowed.** Anything destructive (like deleting) can never be set to Allowed.
- **Who can use it:** coloured chips for Maya, Ryan, Sara and Victor; click to give or take away an app (for example, give your calendar to Sara for appointment planning). Jarvis always has every app. Reset puts back the usual members.

The apps

- **Apps from your Claude account:** every connector you added on claude.ai. Connected apps show as cards (on/off, who can use it, and the three rules: reading, making changes, deleting or paying); apps in your account that still need a sign-in show as small tiles with a **Sign in** button; popular apps you haven't added have a **Connect** button. A **search bar** and filters (All, Connected, Sign in needed) find any app.
- **Connecting an app:** click Connect or Sign in; claude.ai opens on its connectors page, where you click Connect and sign in. A banner in the Tool Hub waits for you, checks again every few seconds and when you come back, and goes away by itself with "Gmail is connected" once it is.
- **Built in, nothing to set up:** web search, lessons, documents & code, meeting recorder, screen look, reminders, project board, team folders, skills, team (members asking each other) and the coding supervisor.
- Turn each one on or off; nothing else can be added in this version.
- **Claude Code's own tools, for every expert** (on by default; Settings → Conversation): reading and writing files, finding and searching files, web search and web pages, running commands (for example Python for exact calculations or charts) and to-do lists, next to Jarvis's own tools. Each expert works in their own folder, so whatever they create is saved there (Team page → Open folder).
  - **Allowed:** reading any team folder, saving and editing in their own folder, the web, commands that only look.
  - **Asks you first:** running other commands, anything outside the team folders, files that may hold keys or passwords. The popup says who wants to do what, e.g. "*Let Victor run a command on your computer?*"
  - **Refused:** writing in a teammate's folder (they ask that teammate instead).
  - Everything they change or run is listed on the Activity page. Your own Claude Code settings never override these rules, and permission checks are never skipped.

19 Conversations and history

- Chats are organised into **conversations**. A new one starts when you open Jarvis, after 30 quiet minutes, or when you click **New chat**.
- The **History** panel next to the chat lists them by Today, Yesterday, Previous 7 days, Previous 30 days and by month, each with a title, time and the coloured dots of who took part.
- **Search** finds words in any old conversation.
- **Open** an earlier conversation to read it (with dates between days), and **Continue** it: each member picks up exactly where they left off.
- **Select and delete** conversations, or a whole day, for good. Chats from the voice card and floating box go into the same conversation.
- Settings: keep history on this computer (on by default), or switch it off and clear everything.

20 Activity

- Everything your team did in your apps, **grouped by day**: time, who did it (with their colour), what they did and in which app, and the result (Done, Blocked, You said no, Failed).
- Select entries, a whole day, or all, and **delete them for good**.

21 Safety, permissions and privacy

You stay in control

- **Every action passes your permission settings** before it happens: Off, Ask me first, or Allowed, per ability, per app.
- **Anything that sends, deletes, spends or acts** asks you first with a clear description of exactly what will happen. Deleting can never be set to Allowed.

- **Members only use the apps you give them** (Who can use it). Asking for anything else is blocked.
- **Everything is logged** in Activity.
- **Content is never obeyed:** text inside emails, documents, web pages, transcripts and screenshots is treated as information, never as instructions, even if it claims to come from you.
- **Coding work never skips permission checks;** risky steps come to you. Even when you let the team decide, publishing online, anything outside the project folder and password files are left for you.

Your data stays yours

On your computer	Chats and history, members' memory and folders, profiles, reminders, the board, transcripts, meeting videos and screen pictures you chose to keep (in your Videos folder), voices and speech recognition, settings.
In the Windows Credential Manager	App keys. Sign-ins to your apps are kept by your Claude account (claude.ai), never by Jarvis.
Sent to Anthropic	Your requests to the team go to Claude on your own plan, through Claude Code. Jarvis never reads or stores your Claude login.
Sent to other services	Only what you use: web searches go to the search service (Exa); app actions (email, calendar and the rest) go through your Claude account to that app's own service.
Never uploaded	Your voice. Speech recognition and the natural voices run on your computer.

Health and money safety

Sara is not a doctor and Victor is not a licensed adviser. They give careful, evidence-based information, say clearly when something needs a professional, and send you to emergency help for warning signs.

22 Settings reference

Settings has a list of sections on the left (You, Conversation, Voice, Meetings, Coding, Setup) and one row per setting: what it does on the left, its switch or button on the right.

Setting	What it does
Speak replies aloud	One switch for every answer: in the chat, the floating box and push-to-talk. Off, answers are only written (spoken questions get theirs on the voice card).
Pause music and videos…	Pause other media while you talk and while the team speaks (on by default).
Keep chat history	Keep conversations on this computer; clear them.
How Jarvis explains things	Automatic, Like I'm five, Student, Professional.
Natural voice	Download and speaking speed (each member's voice is set on the Team page).
Voice shortcuts	Push-to-talk (default `Ctrl+Alt+Space`) and show/hide answer card (default `Ctrl+Alt+J`). Click a box and press the keys one at a time (no need to hold them), click away and Save. Any number of Ctrl, Alt, Shift and Windows keys plus one main key; shortcuts that would break other apps (a plain letter, Ctrl+Tab, Ctrl+C…) are refused with the reason.
Coding supervisor	How much Ryan may approve, update interval, speak updates, watch your own Claude Code sessions.
You	Your name and how to say it (type it the way it sounds, then Hear it).
Welcome & uninstall	Meet the team again, run the setup again, uninstall Jarvis.

The Team page

For each member: rename, choose their natural voice (Play sample), see their apps and skills, read, edit, summarise or erase what they remember, open their folder, and talk to them. Maya's card also sets the morning-plan time and shows upcoming reminders. The shared project board is at the bottom.

23 Installing, updating and uninstalling

- **Install:** run the installer; choose the folder; Jarvis opens and the welcome guides you (section 2).
- **Update:** run a newer installer over the old one. Your chats, memory, folders, settings and sign-ins are kept.
- **Uninstall:** Settings → **Uninstall Jarvis**, or Windows Settings → Apps → Jarvis. Uninstalling removes the app **and everything Jarvis kept**: settings, chats, memory, team folders, voices and speech models, saved sign-ins in the Windows Credential Manager, the Claude Code hooks it added, and its own saved Claude sessions, as if it had never been installed. Claude Code itself, your own projects and any meeting videos you chose to keep (Videos → Jarvis Meetings) are not touched.

> **Disk space after a full setup:** about 1 GB without speech recognition models; about 2.6 GB on an NVIDIA computer with natural voices and fast speech recognition; plus Claude Code (about 350 MB) if it wasn't already installed.

24 Current limits and what's next

Today	Planned or possible
Windows only	A Mac version (built and signed on a Mac).
The installer isn't code-signed, so Windows shows a warning	A code-signing certificate removes the warning and protects updates.
Fast speech recognition needs an NVIDIA graphics card; other computers are slower	A light, fast model for ordinary laptops, and an optional **Jarvis Cloud Voice** (streaming recognition and premium voices) for any computer.
Connecting an app opens claude.ai in your browser (other apps cannot add a connector to your Claude account for you)	Connecting inside Jarvis, if Anthropic offers a way to do it.
Phone health data (Apple Health, Android Health Connect) isn't connected	Import a health export into Sara's profile; later, wearable services (Oura, Garmin, Fitbit) or a companion phone app.
Typical time from you stopping talking to the first spoken word: about 3.5–5.5 seconds	Smarter end-of-turn detection, keeping Claude ready between messages, and speaking sooner, aiming for about 1.5–2.5 seconds.
The experts' playbooks were written from standard references	Review by professionals, exact calculators (calories, EMI, tax), and a side-by-side test against plain Claude.

25 Quick reference

Shortcuts

`Ctrl+Alt+Space`	Push-to-talk from any app (press again to stop, or just pause)
`Ctrl+Alt+J`	Show or hide the answer card
`Ctrl+Shift+Space`	Floating chat box
`Space` · arrows · `F` · `Esc`	In a lesson: pause · step · side/full screen · close

Things to try

Maya

- *Plan my day.*
- *Check my email for deadlines and draft the replies that need me.*
- *Remind me to pay the electricity bill on the 5th.*
- *Prep me for my interview tomorrow at 11.*
- *Play Blinding Lights by The Weeknd.*

Ryan

- *Add a dark mode to my app.* (he writes the spec first)
- *Record this meeting and note down my tasks.*
- *I want to also add payments. Should we?* (scope guard)
- *How's the project going?*
- *Review what Claude changed today.*

Sara

- *My HbA1c came back 6.1. Should I worry?*
- *Explain this blood report.* (pick the PDF)
- *Make me a vegetarian high-protein meal plan.*
- *I sleep badly after late classes.*
- *Which health screenings should I do this year?*

Victor

- *Should I buy a 90,000 rupee laptop on EMI?*
- *Help me write my investment rules.*
- *Make me a budget from this bank statement.*
- *Avalanche or snowball for my two loans?*
- *Is this café idea profitable?*
